Cryptography Game

Matthew Blanchard

CYEN 3331_01

3/22/26

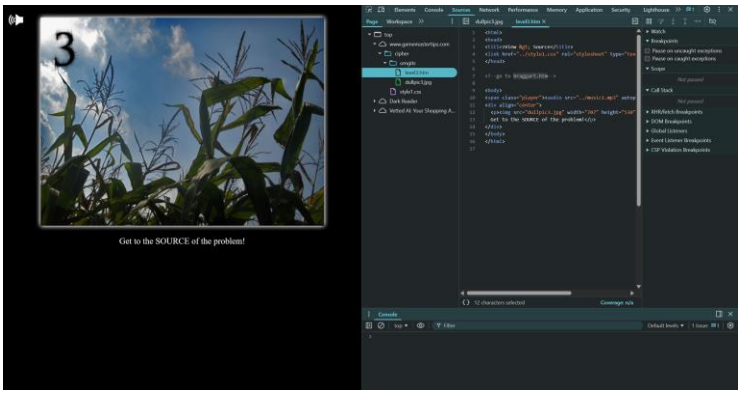
Level 1:

Clicked on the door.

Level 2:

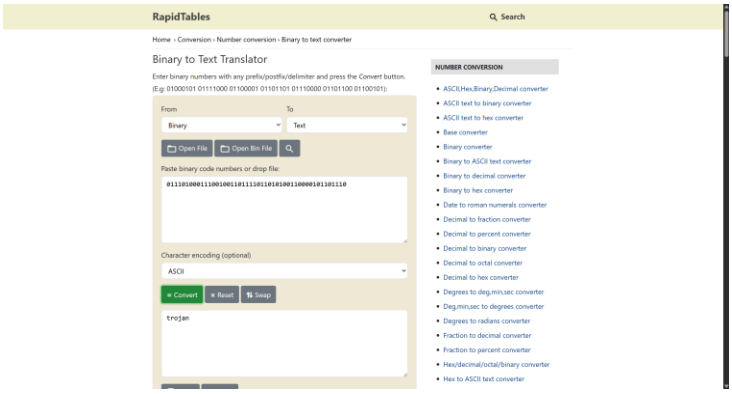
Changed the URL from level2.htm to level3.htm.

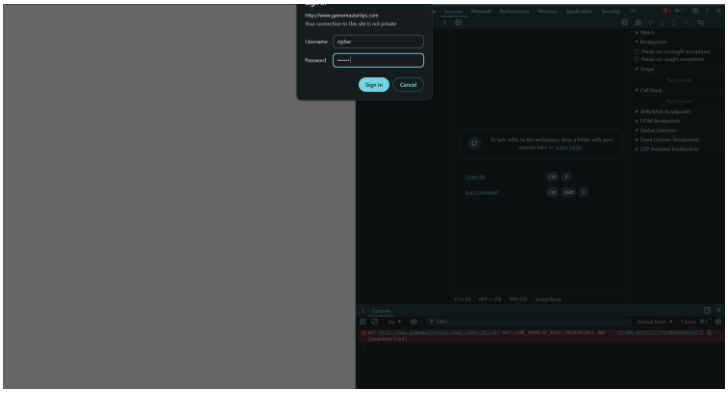
Level 3:



Opened the console with F12 and went to the Sources tab. There, folders were noticed. Opening the folders and checking the files, a comment was found in level3.htm to 'go to braggart.htm'. Replacing level3.htm in the URL with braggart.htm led to level 4.

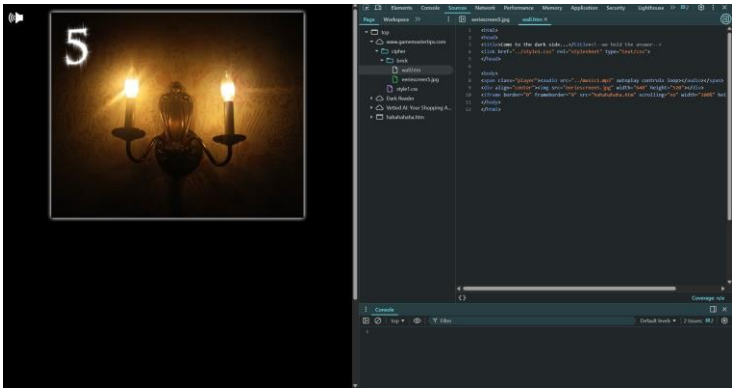
Level 4:

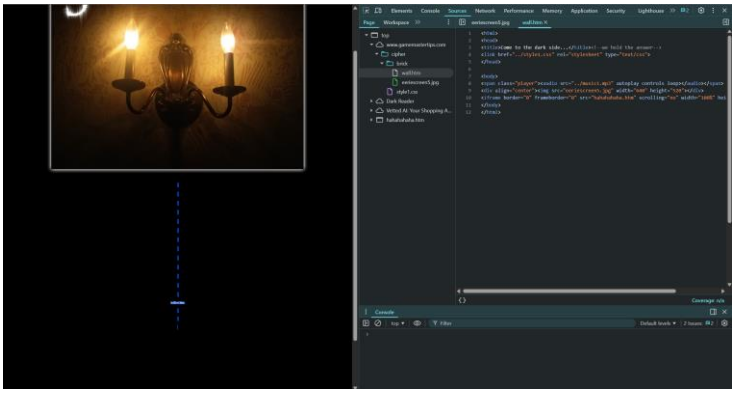




Translated the shown binary string into text, resulting in 'trojan'. Clicking around revealed a new site by clicking on the number '4'. The username was brute-forced using words found in the source code and URL. The username was cipher from the URL, and the password was trojan from the previous page.

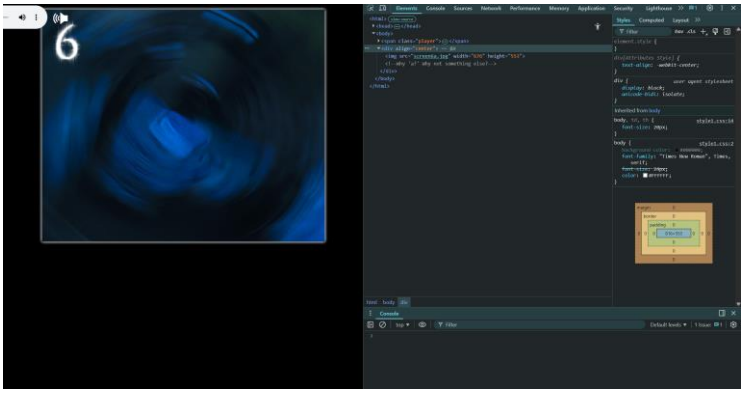
Level 5:

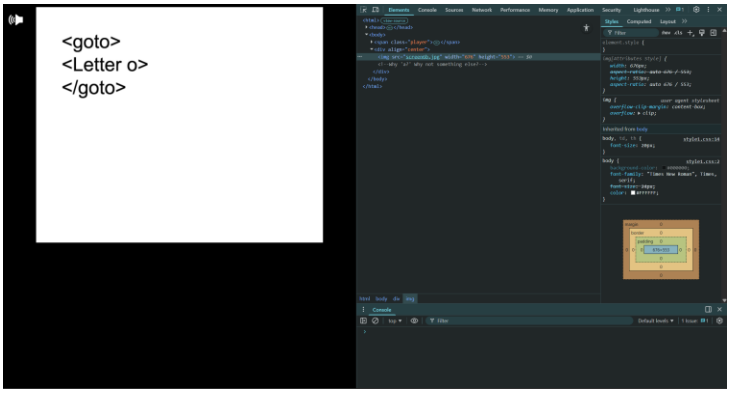


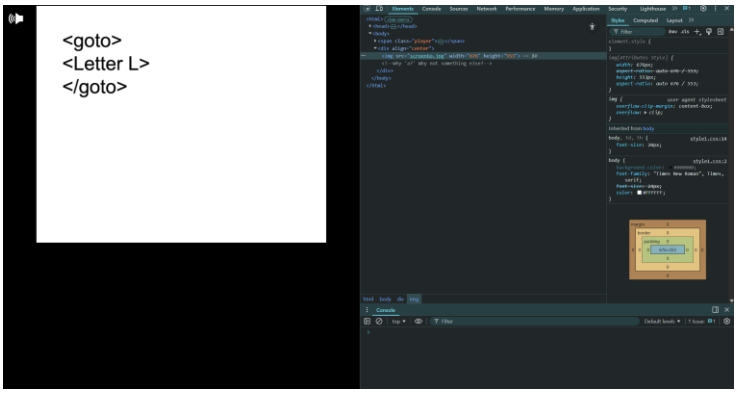


Checked the source code, which indicated to go to the dark side. The dark spaces on the site were examined. A scrollbar on the right indicated there was content or space further below the image. Attempted to drag the image around and accidentally highlighted an empty space. Highlighting the whole page revealed the .htm for the next level, hollow.htm, within the highlights.

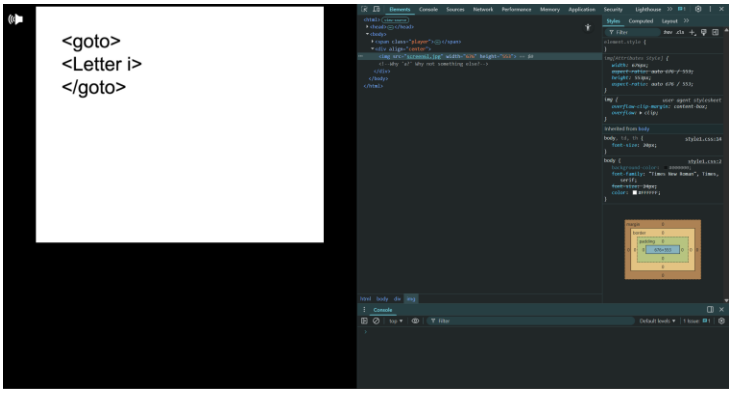
Level 6:



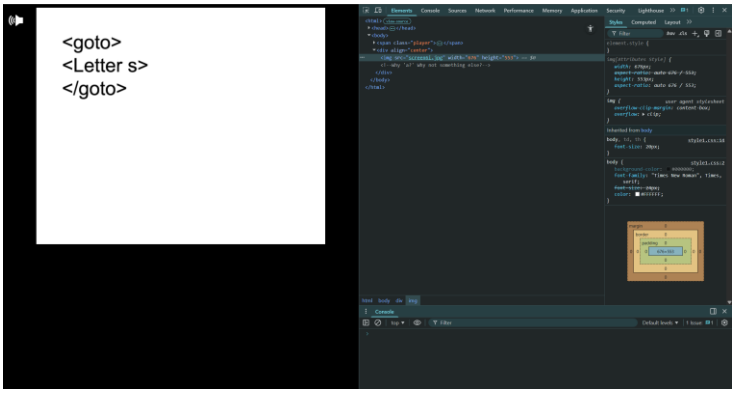




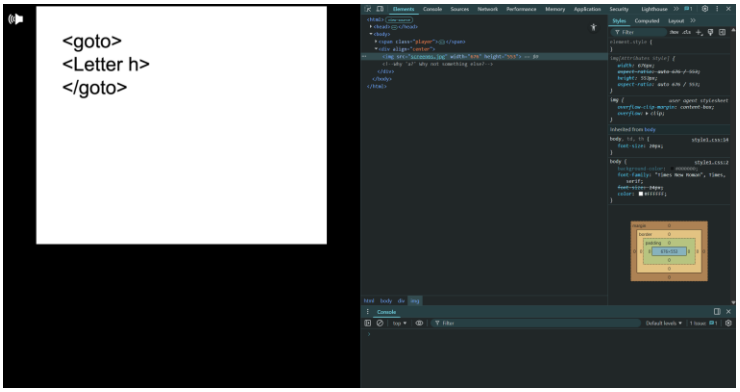
<goto>
<Letter L>
</goto>



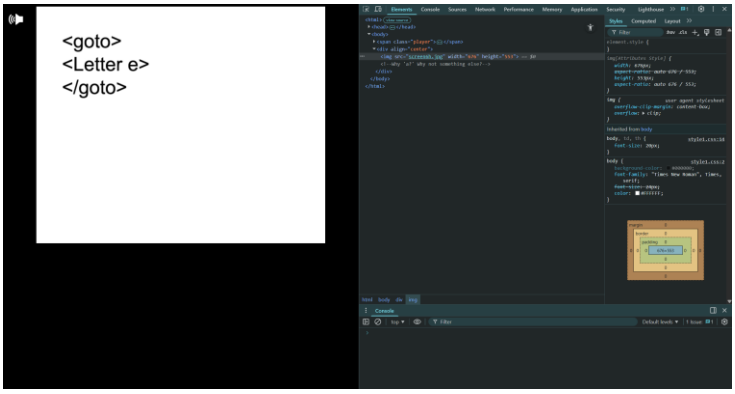
<goto>
<Letter i>
</goto>

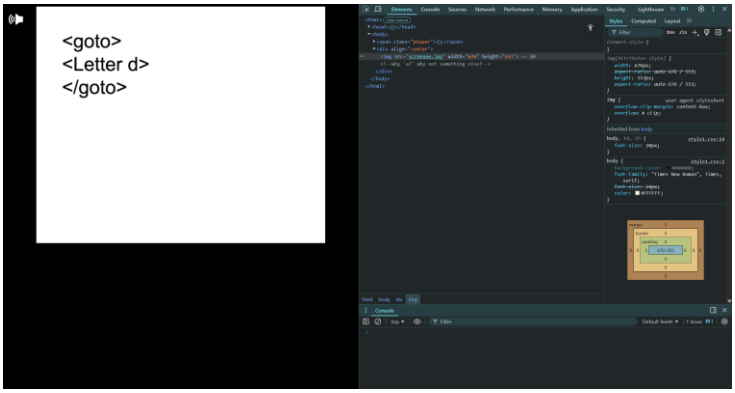


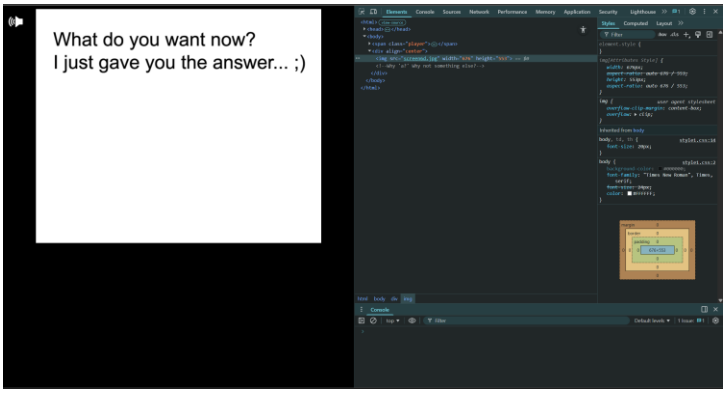
<goto>
<Letter s>
</goto>



<goto>
<Letter h>
</goto>

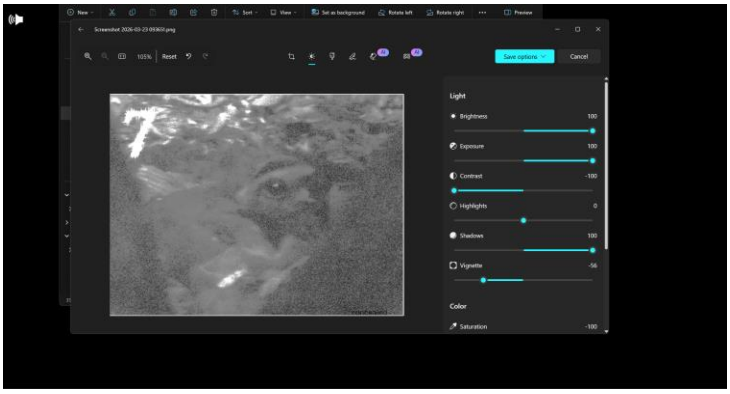






Checked the source and noticed it mentioned the letter 'a' in the jpg source. Attempted to change the letter in the Sources tab, which did not work. Moved to the Elements tab where the code could be altered and replaced 'a' with 'b'. The picture changed to text indicating to go to another letter. The letter was changed in sequence according to the picture, noting the letters that led to another image in order. This produced the word 'abolished'. Replaced the .htm with abolished.htm and progressed to level 7.

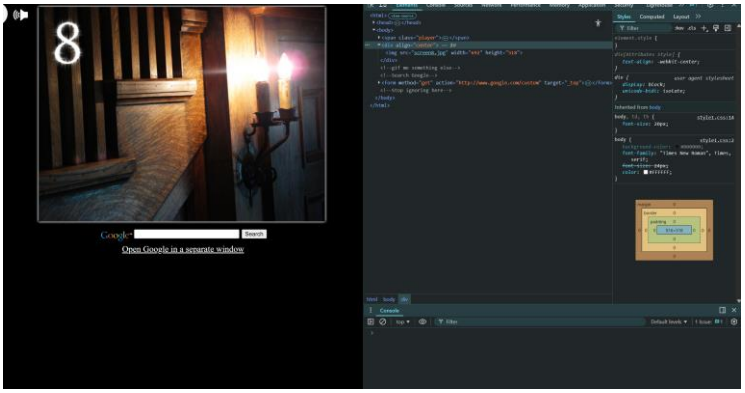
Level 7:

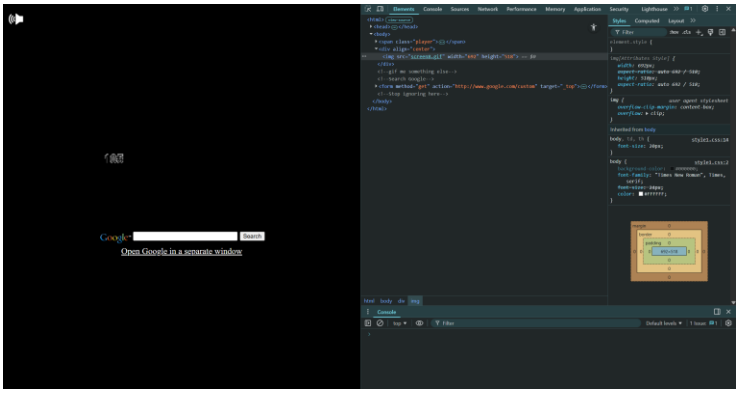


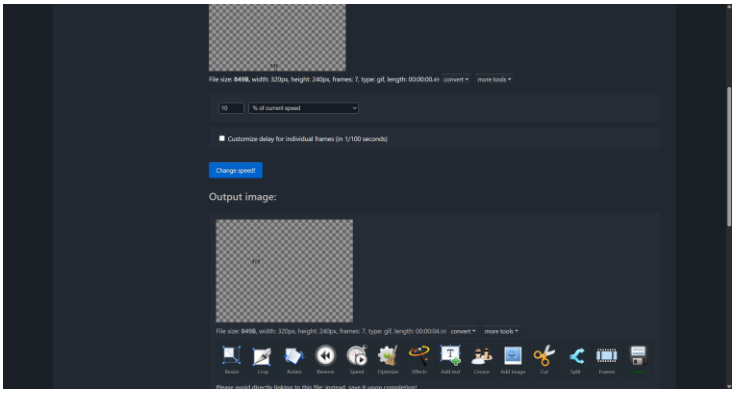
Right answer, but this one isn't a URL. Don't forget that some levels involve password bonus.

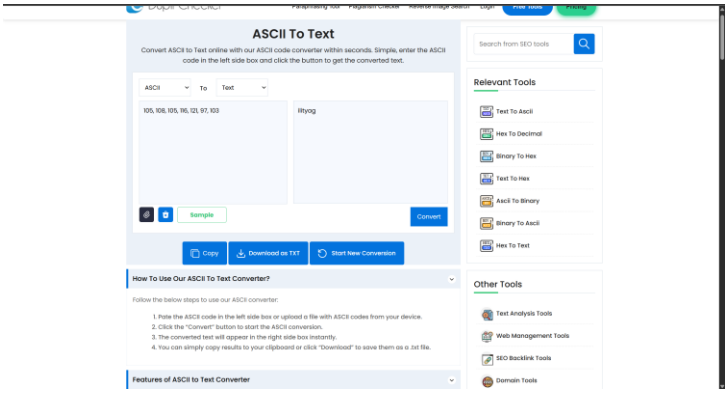
Looked at the source code, which indicated to 'illuminate the darkness'. Attempted to edit the CSS to a white background, which did not work. Tried changing the image name to reference light, which also did not work. Increased the brightness of the display and examined the dark parts of the picture closely. A word was noticed in the bottom right corner of the image. Replaced the .htm with 'conceled.htm'. It was discovered that 'concealed.htm' was incorrect. 'Concealed' was identified as a password for a password box. Clicking around the image, similar to level 4, revealed that the eye-like icon opened a text box. Entered cipher as the username and concealed as the password.

Level 8:



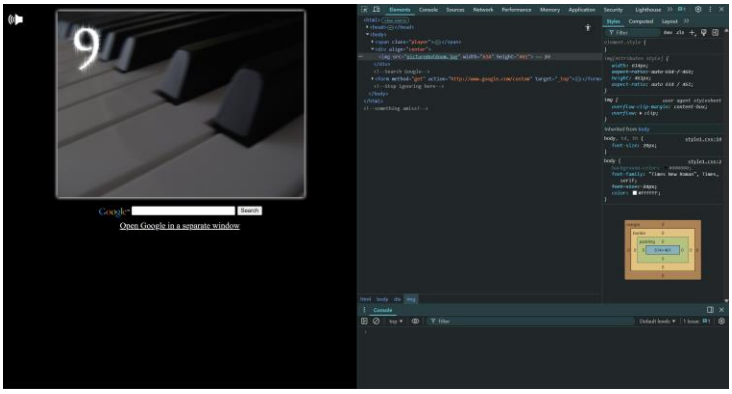


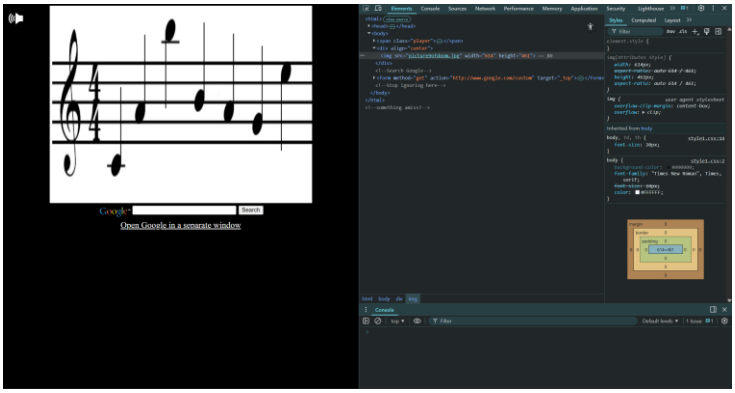




Examined the source file, where line 9 containing the jpg source had a comment at the end stating 'gif me'. This suggested an extension change where jpg appears in the file name. Replaced jpg with gif, which changed the static image to a gif with flashing, moving numbers. To read the numbers, the gif animation needed to be slowed down. The gif was downloaded, and an online tool to slow down gifs was used (ezgif.com). The gif was uploaded and slowed to 10% speed. The flashing numbers were 105, 108, 105, 116, 121, 97, 103. Based on prior use of binary, decoding was attempted using an ASCII chart, treating the numbers as decimal representations of letters. This produced the word ilityag. Unscrambling the letters resulted in agility. Following prior URL patterns, agility.htm was appended to the current URL, as no .htm was present.

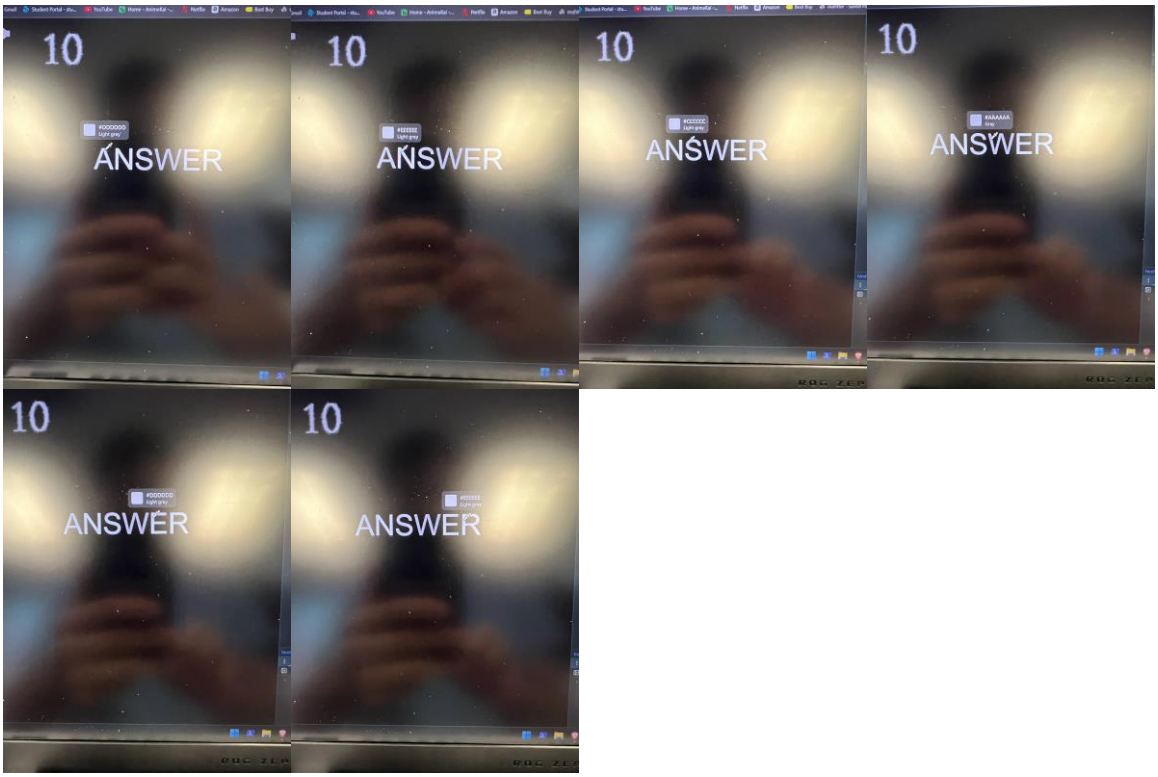
Level 9:

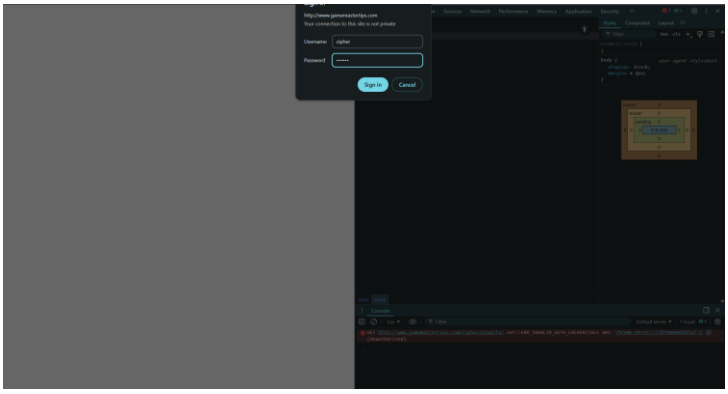




Opened the source file and noticed that the picture source was labeled as 8 instead of 9. This was changed in the Elements tab, which updated the image to music notes. Transcribing the notes yielded cabbage. Replacing the .htm with cabbage.htm allowed progression to the next level.

Level 10:





Checked the source file, where nothing obvious was present. Observing the image, the letter 'W' was greyed out. The level title had the letters 'HEX' capitalized. Based on prior levels, hexadecimal values were inferred to be involved. Using prior knowledge, common hexadecimal values relate to color codes. Since one letter appeared a different color than the others, the level likely involved the hexadecimal color values of the letters in the answer. Using the pipette tool in the built-in snipping tool, the following color values were obtained in order: #DDDDDD, #EEEEEE, #CCCCCC, #AAAAAA, #DDDDDD, #EEEEEE. The answer to this level was decade. Hovering over the image revealed a clickable area, which opened a text box when clicked. Entering cipher as the username and decade as the password completed level 10.
